

# Neural Signatures of Trust in Human-Robot Collaboration: A Tale of Two Use-Cases

Aakash Yadav, Sarah Hopko, and Ranjana K. Mehta  
Industrial and Systems Engineering, Texas A&M University

Aakash is a second-year Ph.D. candidate in the at Texas A&M University. His research interests span human-robot interaction, neuroergonomics, and affective computing.

## Background

### At present

- Manufacturing encompasses 12% of US economy
- Traditional assembly lines are either manual or completely automated

Strictly separated robot workspace

### HRC allows for

- Improved team fluency with complementary skill set
- New possible interaction modes and collaboration

Part of the workspace is shared

### Challenges

- Improved teaming requires human factors considerations, such as trust
- Operator safety is critical as robots are not 100% reliable

Workspaces are full shared

Level of Human Robot Collaboration

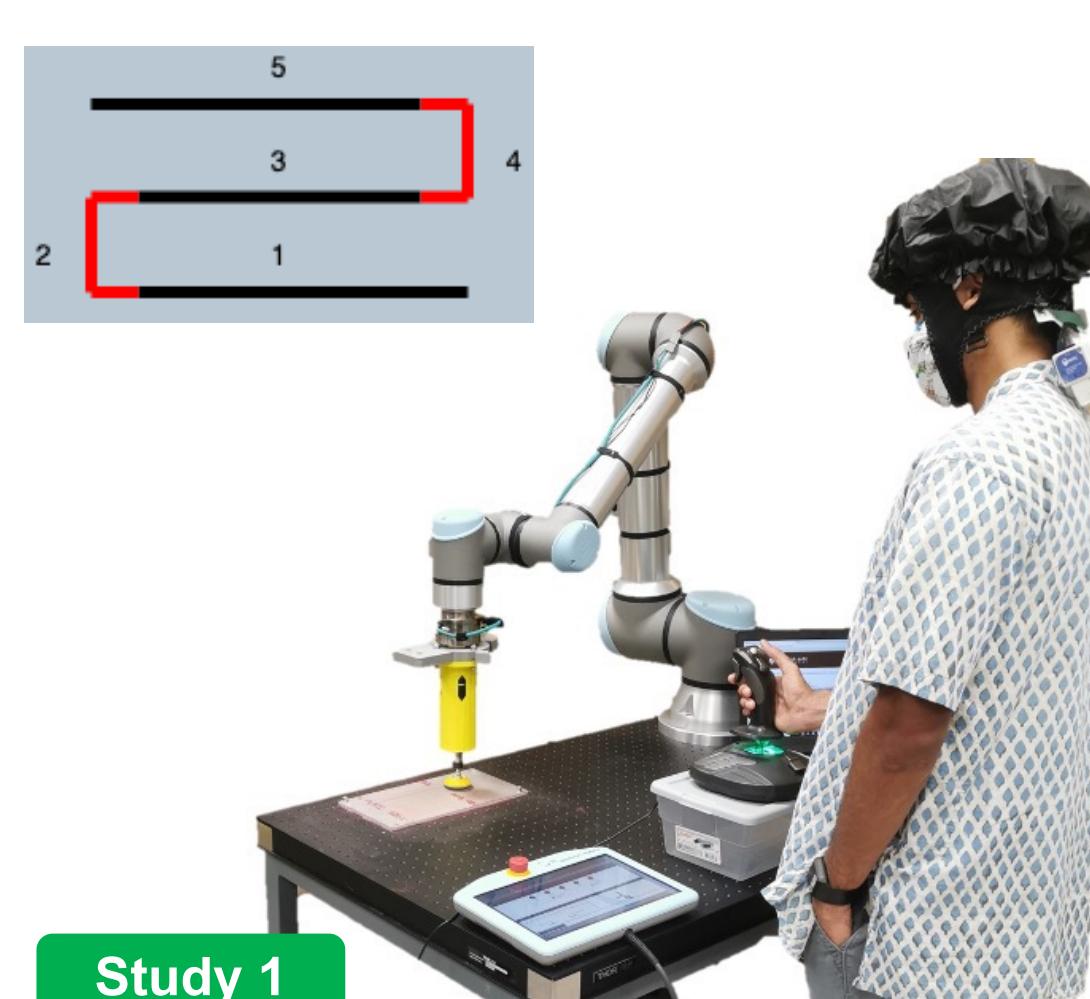

## Methods

### Participants

- Sixteen (age  $25.12 \pm 3.31$  years) and thirty-eight (age  $25.37 \pm 5.7$  years) subjects in study 1 and 2
- Both the studies were approved by the local IRB (IRB2020-0097DCR and IRB2020-0432F)

### Experimental Task 1

- S-shaped metal surface polishing task
- 3-axis end effector control using joystick
- Autonomous takeover during turns

Study 1

### Experimental protocol

- Consent Form
- Background Survey
- Propensity to Trust Survey
- Bioinstrumentation & Baseline
- Familiarization and Practice Trials

	Reliable Condition	Unreliable Condition
Trial 1	1-pt Trust	
Trial 2	1-pt Trust	
:		
Trial 10	1-pt Trust	
	TRUST, SART, NASA TLX	

	Reliable Condition	Unreliable Condition
Trial 1	1-pt Trust	
Trial 2	1-pt Trust	
:		
Trial 10	1-pt Trust	
	TRUST, SART, NASA TLX	

Debriefing

### Experimental Task 2

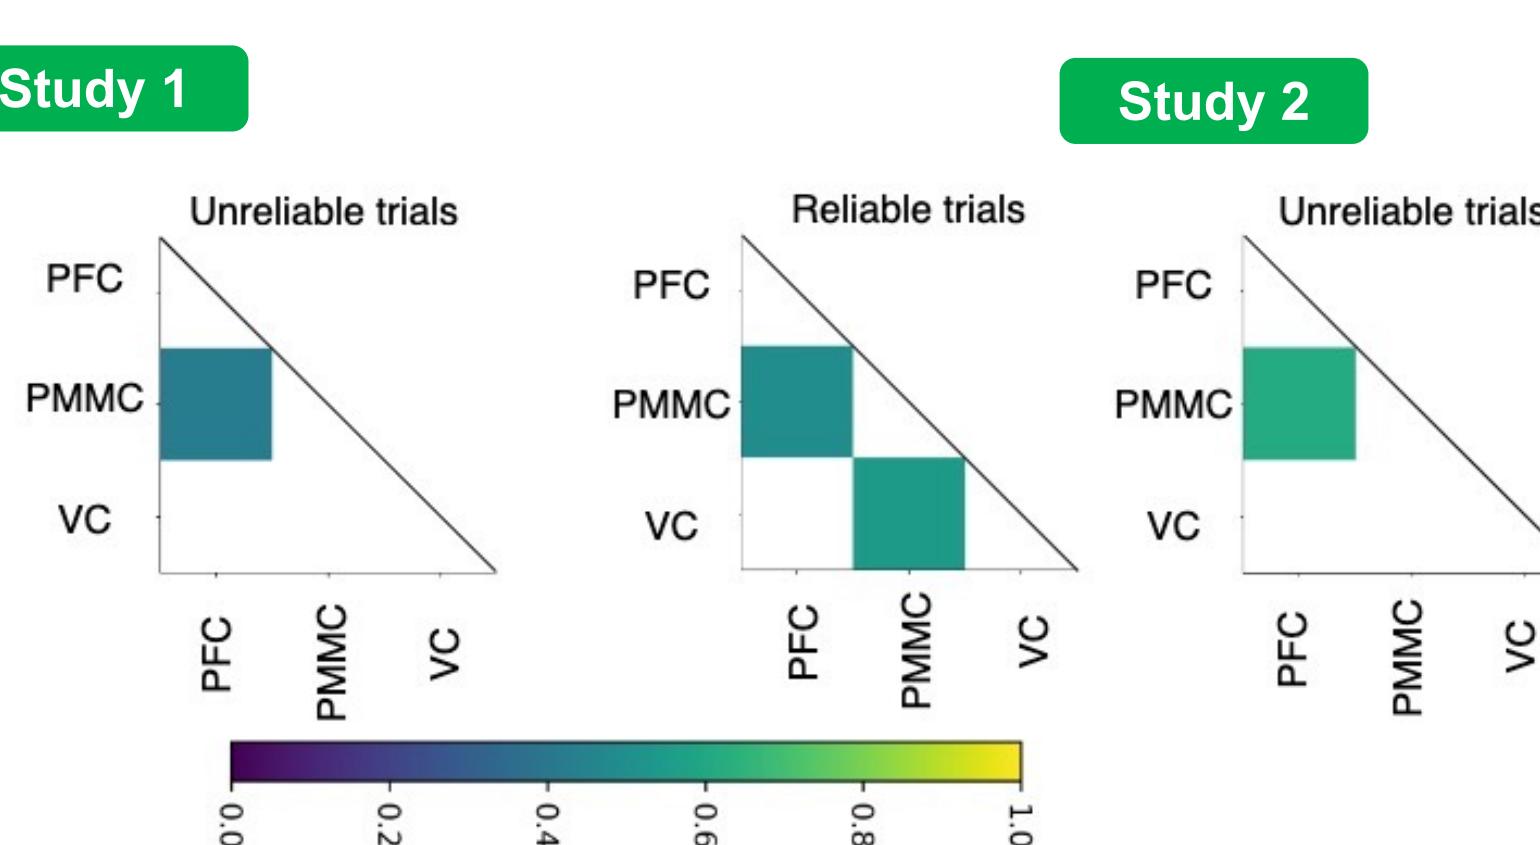

- Planetary gear assembly task
- The robot delivers parts in sequence of assembly

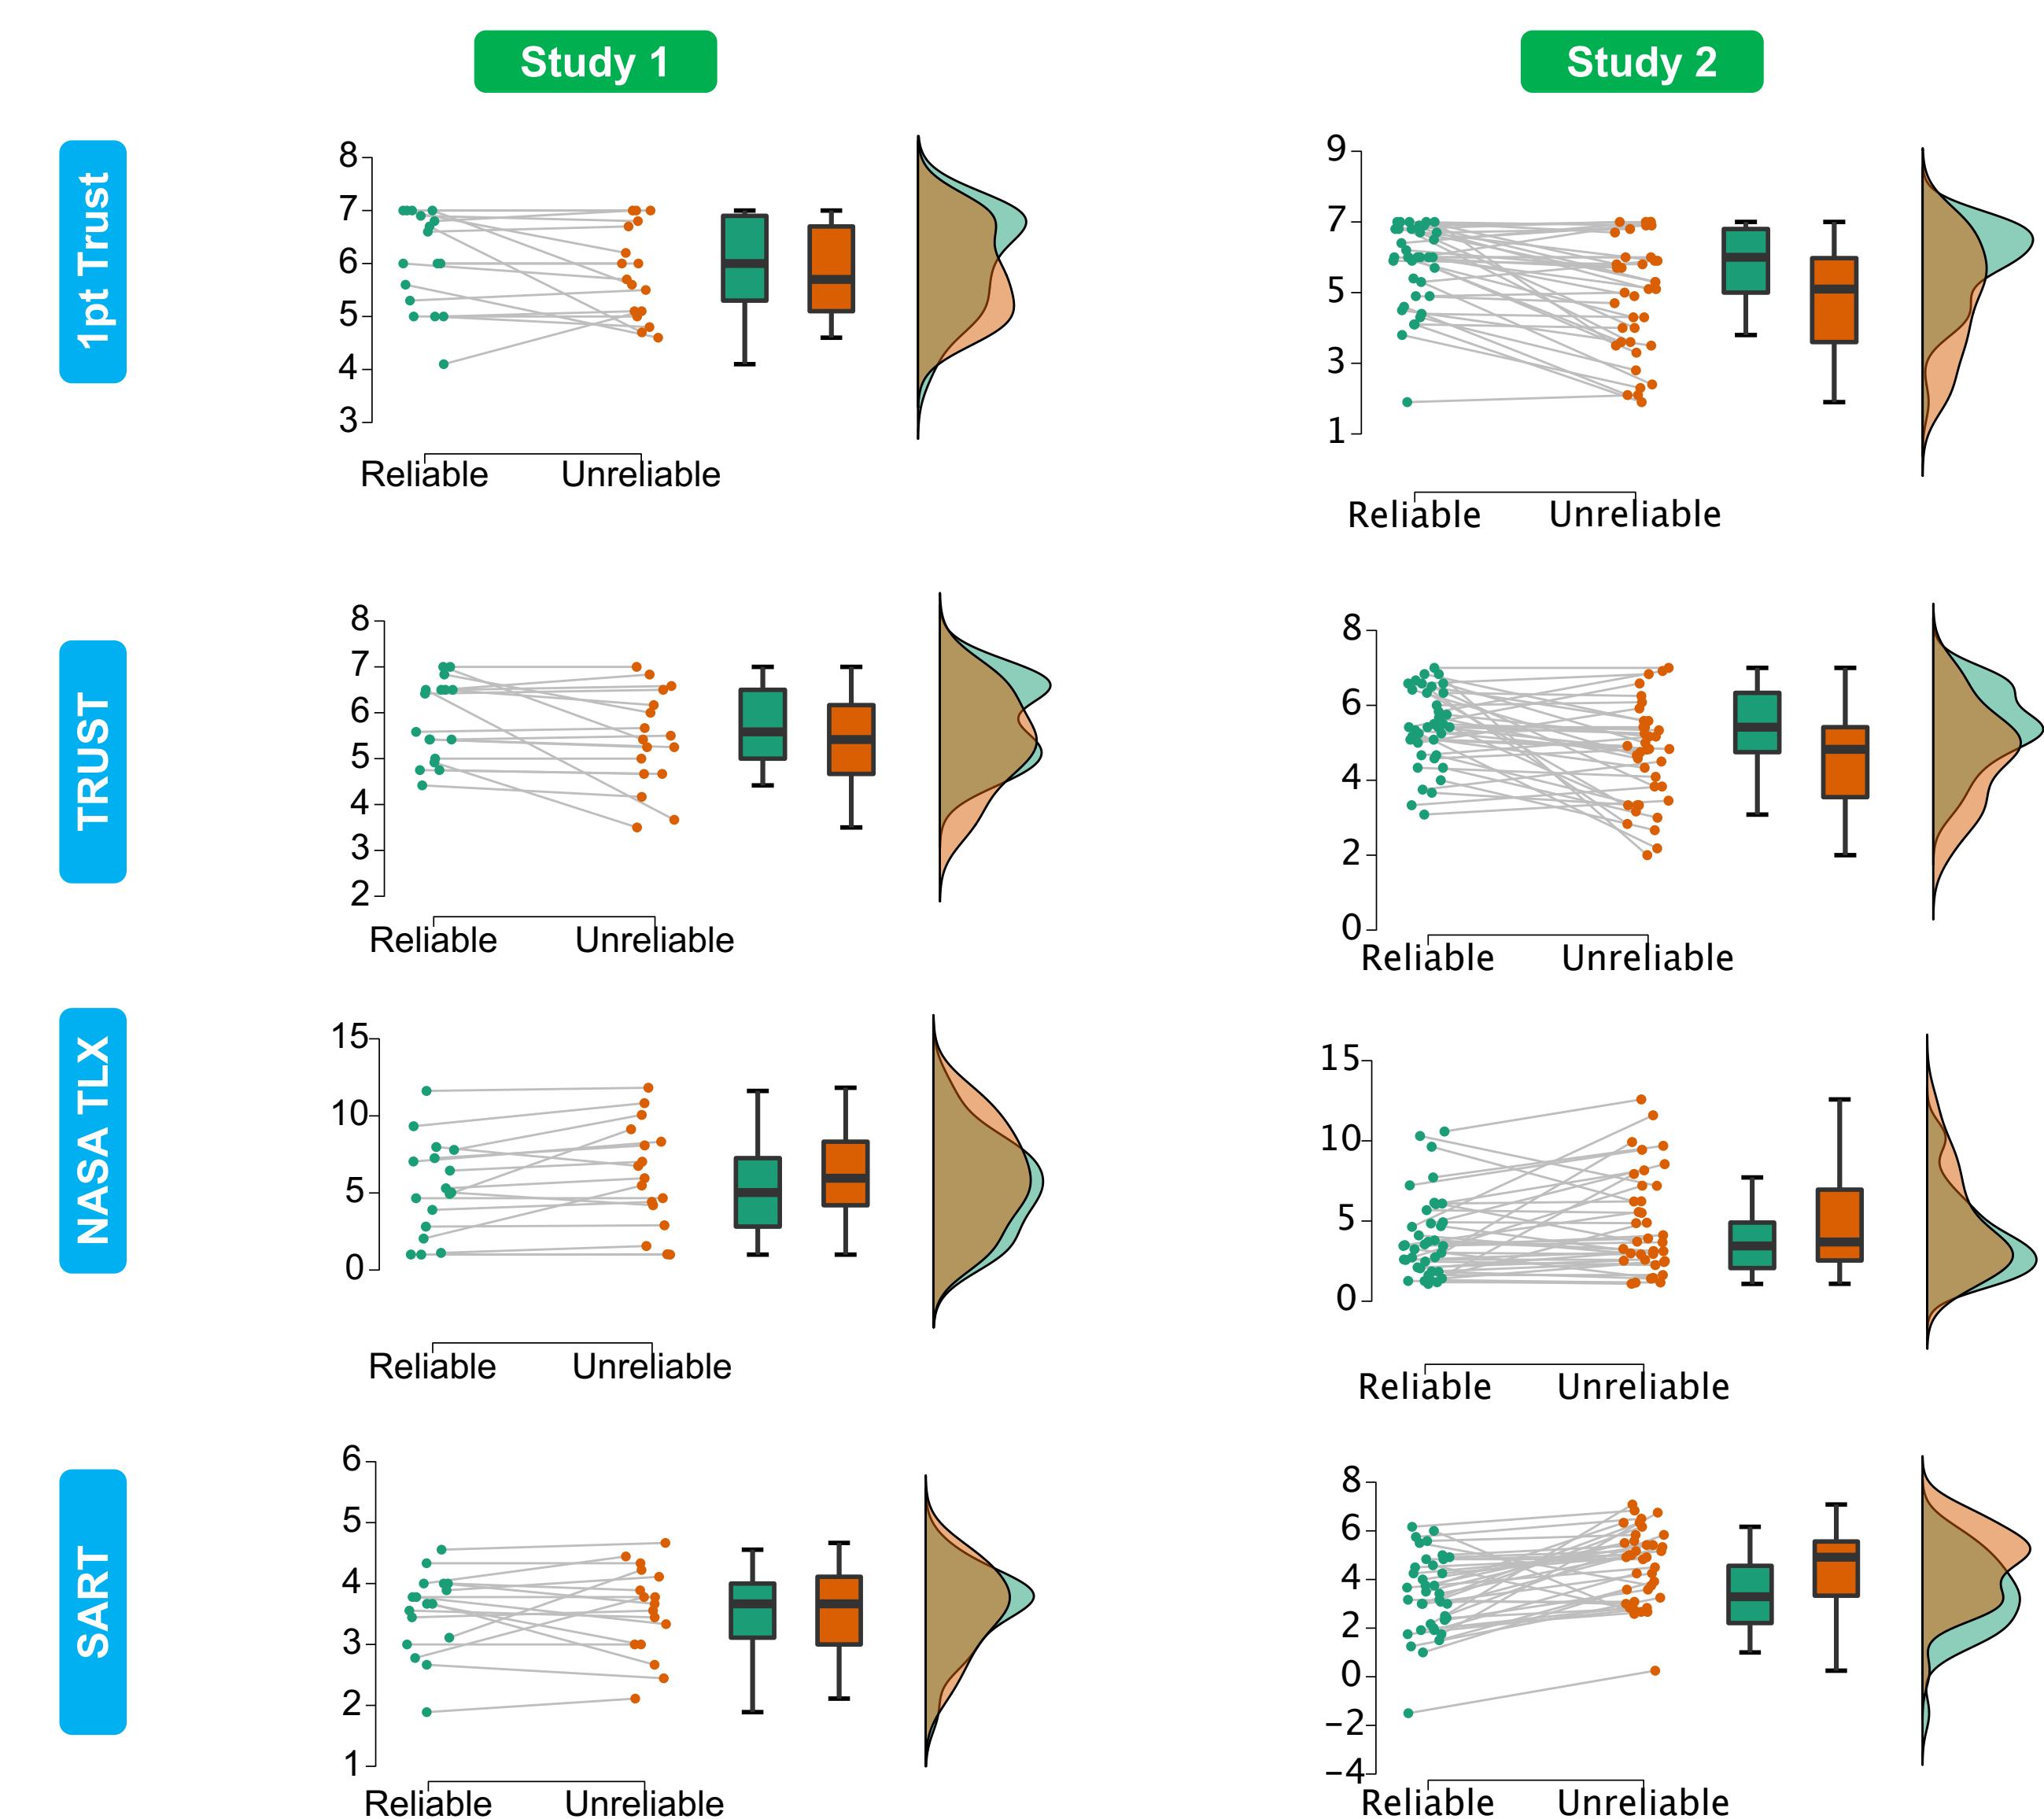

Study 2

## Results

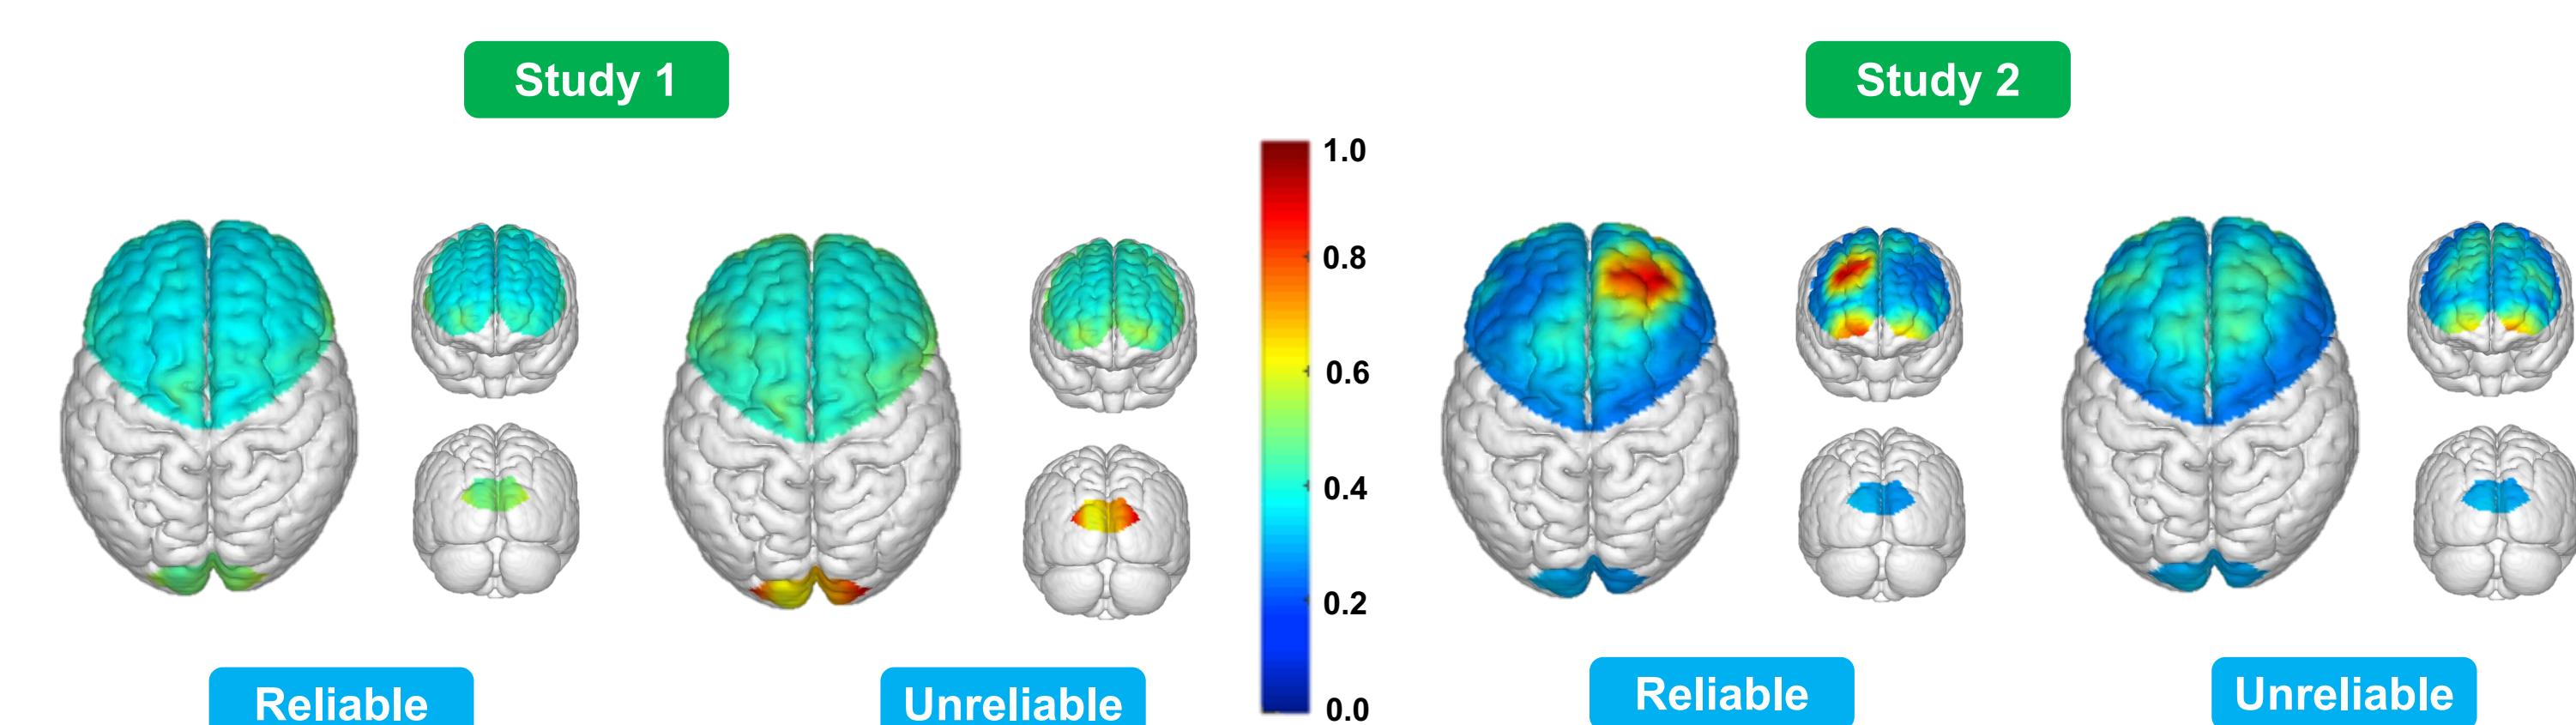

### Functional connectivity

### Subjective Responses

### Brain Activations

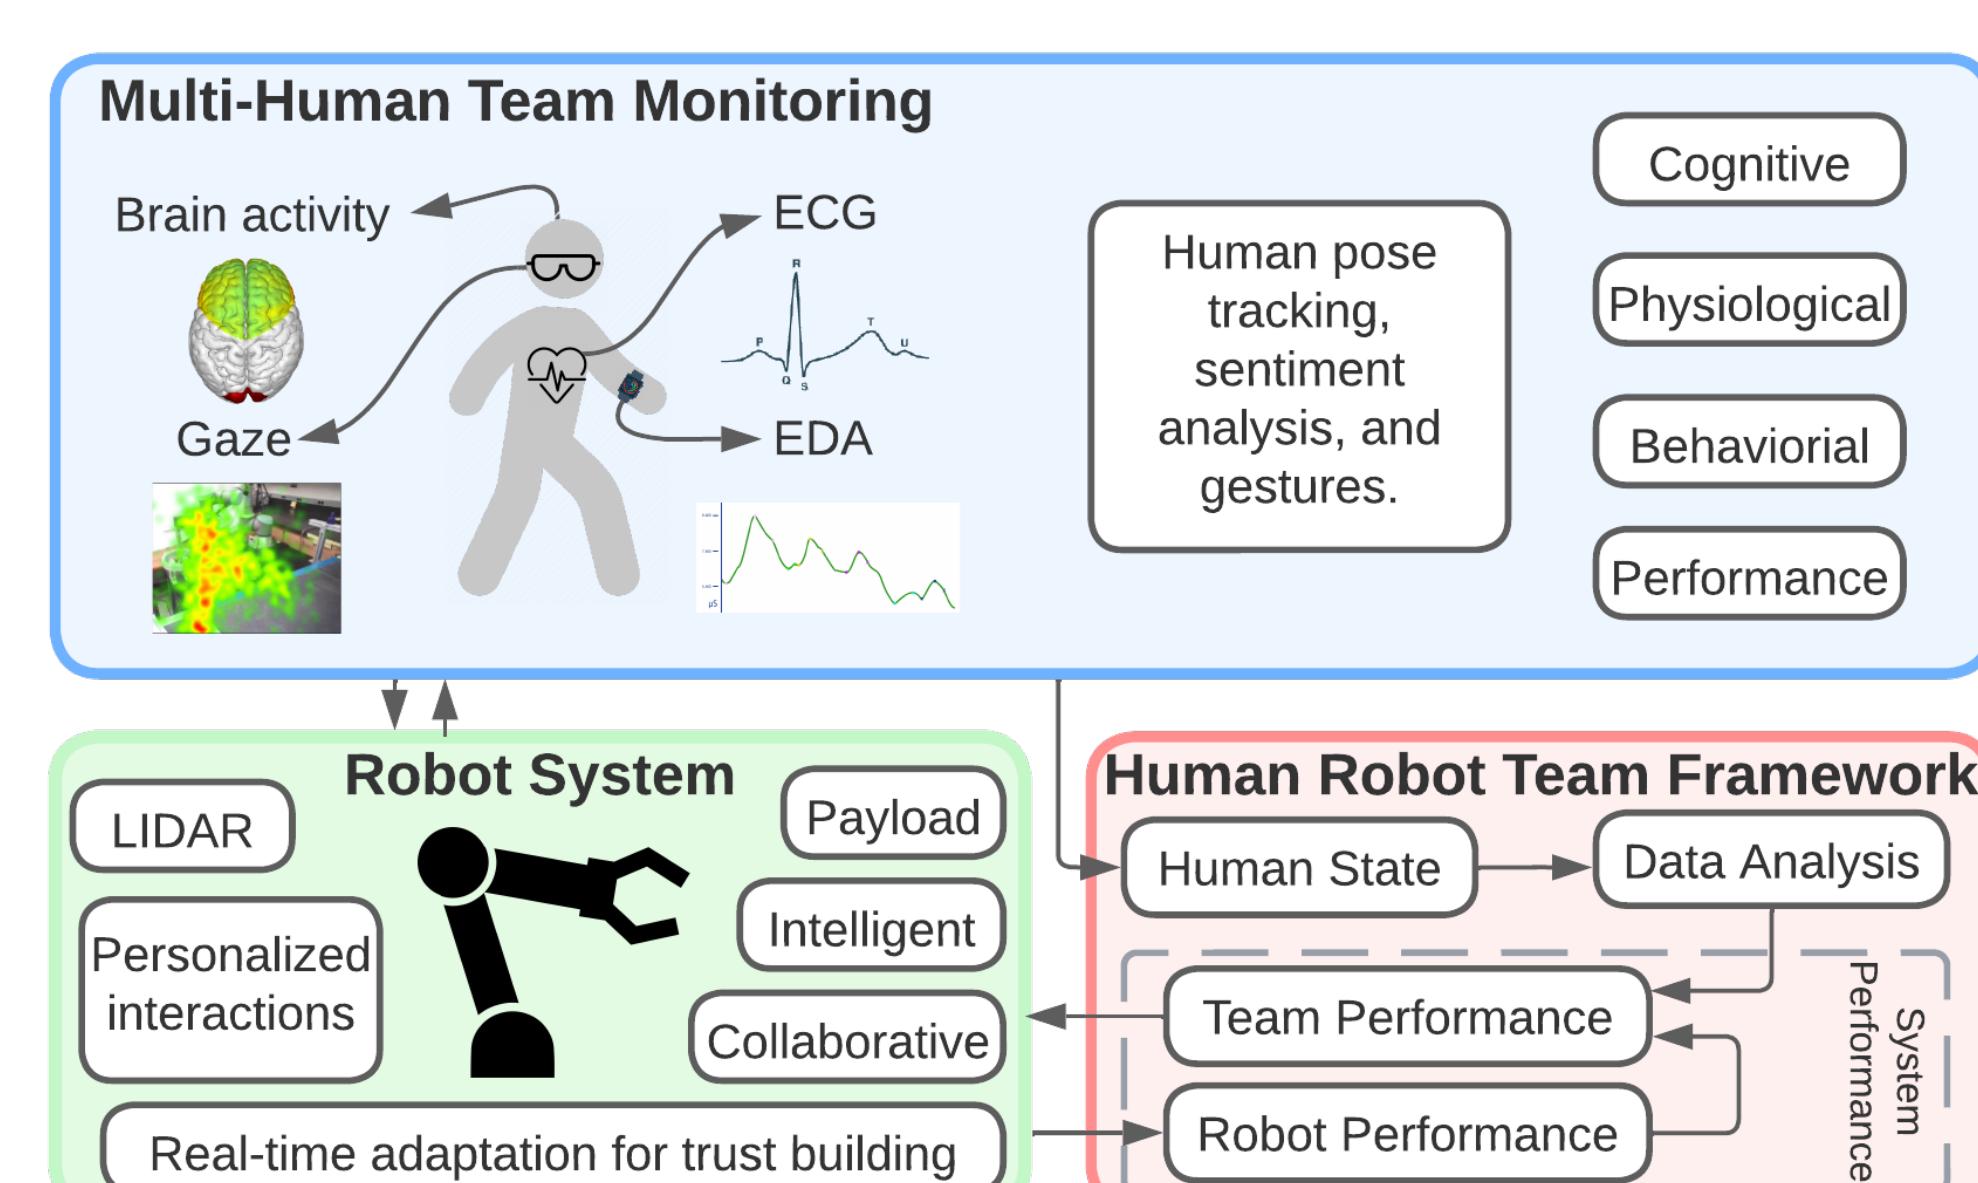

### Heart Rate Variability

- Study 1
- $\text{RMMSD}_{\text{reliable}} < \text{RMMSD}_{\text{unreliable}}$
  - $\text{HF}_{\text{reliable}} < \text{HF}_{\text{unreliable}}$
  - $\text{LF}_{\text{reliable}} < \text{LF}_{\text{unreliable}}$
  - Mean  $\text{HR}_{\text{reliable}} > \text{Mean HR}_{\text{unreliable}}$
- Study 2
- No significant difference was observed in study 2

## Key takeaways

- Subjective response were similar in both the studies
- Perturbations in robot trajectory was able to induce distrust in the robot
- Different neural mechanisms were active due to the inherent task difference
- Subjective responses belies the internal state of the human. They did not change with change in neural activity.
- HRV can only resolve trusting attitudes in relatively static tasks.

### Future work: closed loop robot adaptation
